

# Innovation Booms, Easy Financing, and Human Capital Accumulation

Johan Hombert  
HEC Paris

Adrien Matray  
Princeton University

Wharton, April 5 2023

## Motivation

Intense **technological change** often comes with **financial speculation**

⇒ **Easy financing** for innovative firms

... can pay high wages and **attract talent**

⇒ **Reallocation** of high-skill workers to booming innovative sector

...exposes their **human capital** to **new technologies**

Examples: current AI boom, late 1990s dot-com bubble, etc.

⇒ Matters for **aggregate labor productivity**

## Questions

Effect of innovation booms and easy financing on human capital?

1. Effect of **joining** a booming new technology sector on skilled workers' human capital?
2. Role of **financial capital flows**?

## Effect on human capital ex ante unclear

- Potential **upside**: Exposure to new technologies  $\Rightarrow$  workers acquire **valuable skills**

// Growth-enhancing tech bubbles (Olivier 2000; Caballero Farhi Hammour 2006)

- Potential **downside**:

## Effect on human capital ex ante unclear

- Potential **upside**: Exposure to new technologies  $\Rightarrow$  workers acquire **valuable skills**

// Growth-enhancing tech bubbles (Olivier 2000; Caballero Farhi Hammour 2006)

- Potential **downside**: Skills rapidly **lose value**
  - Skills linked to **rapidly evolving technology**  $\Rightarrow$  vintage-specific human capital (Chari Hopenhayn 1991; Deming Noray 2020)
  - Easy financing  $\Rightarrow$  **lower quality projects**

## Effect on human capital ex ante unclear

- Potential **upside**: Exposure to new technologies  $\Rightarrow$  workers acquire **valuable skills**

// Growth-enhancing tech bubbles (Olivier 2000; Caballero Farhi Hammour 2006)

- Potential **downside**: Skills rapidly **lose value**

- Skills linked to **rapidly evolving technology**  $\Rightarrow$  vintage-specific human capital (Chari Hopenhayn 1991; Deming Noray 2020)

- Easy financing  $\Rightarrow$  **lower quality projects**

- Role of **financial capital flows**?

- **Allocation effect**: does capital flow to firms whose effect on workers' HK is  $>0$  or  $<0$ ?
- **Direct effect** of capital flows on a firm's workers' human capital?

## Empirical design

- **Setup:** Information and Communications Technology (ICT) late 1990s boom
  - Large
  - Plausibly accompanied by speculative capital flows
  - Possible to study long-run effects
- **Data:** Administrative employer-employee panel data for France (1994–2015)

## This paper

1. Sizeable **reallocation** of K and skilled L to ICT sector during boom
  - **1/3 of new cohorts** of skilled workers start in ICT during boom

## This paper

1. Sizeable **reallocation** of K and skilled L to ICT sector during boom

- **1/3 of new cohorts** of skilled workers start in ICT during boom

2. Wage pattern for these workers fifteen years out:

- **6% lower**
  - **Not** explained by **demand effects**
  - **Not** explained by **selection effects**
- ⇒ Lower value of **human capital**

## This paper

1. Sizeable **reallocation** of K and skilled L to ICT sector during boom
  - 1/3 of new cohorts of skilled workers start in ICT during boom
2. Wage pattern for these workers fifteen years out:
  - 6% lower
    - Not explained by demand effects
    - Not explained by selection effects
  - ⇒ Lower value of human capital
3. Capital flows **amplify** the effect

## This paper

1. Sizeable **reallocation** of K and skilled L to ICT sector during boom
  - **1/3 of new cohorts** of skilled workers start in ICT during boom
2. Wage pattern for these workers fifteen years out:
  - **6% lower**
    - **Not** explained by **demand effects**
    - **Not** explained by **selection effects**
  - ⇒ Lower value of **human capital**
3. Capital flows **amplify** the effect
4. Mechanism: accelerated **skill obsolescence**

The ICT Boom

Wage Dynamics

Role of Capital Flows

Mechanism

Wrap-up

## Data

1. Workers: matched employer-employee data for random 1/24<sup>th</sup> of employees
  - High-skill workers: executives and higher intellectual professions
2. Firms: universe of tax files

## The Information and Communication Technology (ICT) Sector

ICT industries	Share of total employment (%)	Share of skilled employment (%)
<b>ICT: Services</b>	<b>1.9</b>	<b>7.8</b>
IT consultancy	0.7	3.4
Software	0.7	3.2
Data processing	0.3	0.8
Maintenance computers	0.1	0.2
Other data/computer-related services	0.1	0.2
<b>ICT: Telecommunications</b>	<b>1.4</b>	<b>2.2</b>
Telecommunications	1.4	2.2
<b>ICT: Manufacturing</b>	<b>1.7</b>	<b>3.7</b>
Electronic/communication equipment	0.8	1.8
Measurement/navigation equipment	0.5	1.2
Accounting/computing equipment	0.2	0.7
Insulated wire and cable	0.1	0.1
<b>ICT: Wholesale</b>	<b>0.5</b>	<b>1.2</b>
Computers, electronics, telecoms	0.5	1.2
<b>ICT: Total</b>	<b>5.4</b>	<b>14.9</b>

OECD (2002) definition, Universe of matched employer-employee data in France (1994–2008)

## ICT boom: equity valuation

- Cumulative stock return: boom → bust → normalization
- (Similar pattern for stock price/sales)

## ICT boom: capital reallocation

- Equity issuance/Total assets for universe of listed+private firms
- (Similar pattern for business creation)

## Labor reallocation: the role of the extensive margin

---

- Reallocation of skilled workers to ICT sector (% skilled employment in ICT)

## Labor reallocation: the role of the extensive margin

- Reallocation of **skilled workers** to **ICT sector** (% skilled employment in ICT)
- Dynamics driven by workers **entering the labor market** (= extensive margin)

## ICT boom: taking stock

1. Large **reallocation** of capital & skilled labor
2. ...that delineates three **cohorts** of workers: pre-boom, boom, post-boom

# Exposure to the boom across cohorts

Equity issuance/Total assets

(Labor market entry)

# Roadmap

The ICT Boom

Wage Dynamics

Role of Capital Flows

Mechanism

Wrap-up

## Wage dynamics: Across workers within boom cohort

---

- Sample: skilled workers starting between 1998 and 2001
- Baseline regression:

$$\log(wage_{i,t}) = \beta_t \cdot ICT_{i,0} + \delta_t + \delta_t \times X_i + \epsilon_{i,t}$$

$ICT_{i,0} = 1$  if worker  $i$  starts career in ICT sector

→ wage premium can reflect sector reallocation post entry

$X_i$  = entry year, sex, age, age squared, two-digit occupation at entry

## Wage dynamics of boom cohort

- 5% higher entry wage

## Wage dynamics of boom cohort

- No premium after boom → standard boom-bust

## Wage dynamics of boom cohort

- 6% lower wage fifteen years out

## Candidate explanations

---

- **Heterogeneous** workers  $i$  (productivity and preferences), overlapping **cohorts**  $c$ , choose sector **at entry**  $k$
- **Human capital** has **two** components:
  - **Fixed** component ( $\approx$  education, ability):  $\theta_{i,k}$
  - **On-the-job** accumulation/depreciation:  $dh_{c,k,t}$
- Two types of **sectoral shocks**:
  - **Productivity** shocks in sector  $k$  (*all* cohorts)
  - **HK** shocks to  $dh_{c,k,t}$  (*sector-cohort* specific)

## Candidate explanations

- Log wage of individual  $i$  from cohort  $c$  in sector  $k$  at time  $t$ :

$$w_{i,c,k,t} = w_{k,t} + \theta_{i,k} + \sum_{\tau=c+1}^t dh_{c,k,\tau}$$

demand/  
supply

worker quality  
(selection)

accumulated  
human capital

## Candidate explanations

- Log wage of individual  $i$  from cohort  $c$  in sector  $k$  at time  $t$ :

$$w_{i,c,k,t} = w_{k,t} + \theta_{i,k} + \sum_{\tau=c+1}^t dh_{c,k,\tau}$$

demand/  
supply

worker quality  
(selection)

accumulated  
human capital

⇒  $\Delta$  average wage between two sectors for cohort  $c$  at time  $t$ :

$$\Delta \overline{w}_{c,t} = \Delta w_t + \Delta \overline{\theta}_c + \sum_{\tau=c+1}^t \Delta dh_{c,\tau}$$

## Candidate explanations

- Log wage of individual  $i$  from cohort  $c$  in sector  $k$  at time  $t$ :

$$w_{i,c,k,t} = w_{k,t} + \theta_{i,k} + \sum_{\tau=c+1}^t dh_{c,k,\tau}$$

demand/  
supplyworker quality  
(selection)accumulated  
human capital

⇒  $\Delta$  average wage between two sectors for cohort  $c$  at time  $t$ :

$$\Delta \bar{w}_{c,t} = \Delta w_t + \Delta \bar{\theta}_c + \sum_{\tau=c+1}^t \Delta dh_{c,\tau}$$

- Tighter identification ([across](#) cohorts) rules out [demand/supply](#) and [selection](#)

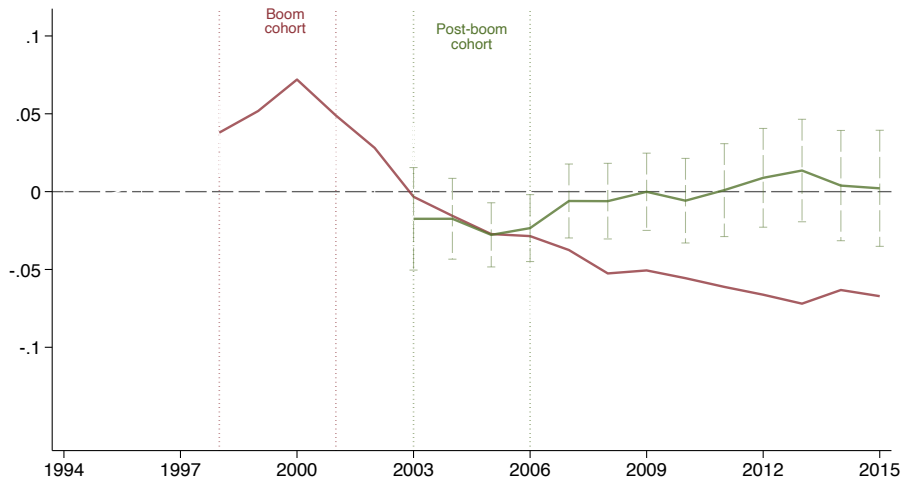

## Ruling out labor market imbalance

$$\Delta \bar{w}_{c,t} = \underbrace{\Delta \mathbf{w}_t}_{\text{demand/supply}} + \underbrace{\Delta \bar{\theta}_c}_{\text{worker quality (selection)}} + \underbrace{\sum_{\tau=c+1}^t \Delta dh_{c,\tau}}_{\text{accumulated human capital}}$$

- **Hypothesis:** low labor demand/oversupply of labor in ICT after the boom
- **Implication:** **post-boom cohort** should also experience wage decline

## Wage dynamics of **post-boom** cohort (2003–2005)

- **Inconsistent with labor market imbalance** [statistical difference]

## Ruling out selection

$$\Delta \bar{w}_{c,t} = \cancel{\Delta w_t} + \Delta \bar{\theta}_c + \sum_{\tau=c+1}^t \Delta dh_{c,\tau}$$

demand/  
supply                  worker quality  
   (selection)                  accumulated  
      human capital

- Hypothesis: boom attracts less able workers
- Implication: pre-boom cohort should not display wage decline

## Wage dynamics of pre-boom cohort (1994–1996)

- Inconsistent with selection [statistical difference]
- Consistent with HK depreciation for all cohorts experiencing the boom

## Ruling out selection

Other tests of negative selection:

- No decline in education
- Quantile regressions: not an additional mass of bad outcomes

## Main specification: across sectors + across cohorts

- Sample: boom cohort (1998–2001) + post-boom cohort (2003–2005)
- Estimating equation

$$\log(\text{wage}_{i,c,t}) = \beta_t \cdot \text{ICT}_{i,0} \times \text{BoomCohort}_c + \delta_t \times \text{ICT}_{i,0} + \alpha_i + \gamma_{c,t} \times X_{i,0} + \epsilon_{i,t}$$

- $\beta_t$  = wage premium in year  $t$  of workers starting

in ICT sector vs. other sectors

during the boom vs. after the boom

## Long-term wage decline

- Starting in ICT during boom (98-01)  $\Rightarrow$  **7% slower** long-term wage growth from 2003 to 2015

	log(wage)
ICT <sub>0</sub> × BoomCohort × 2003-05	0.001 (0.013)
ICT <sub>0</sub> × BoomCohort × 2006-10	-0.035** (0.014)
ICT <sub>0</sub> × BoomCohort × 2011-15	<b>-0.073***</b> <b>(0.019)</b>
ICT <sub>0</sub> × Year FE	✓
Worker controls × Cohort × Year FE	✓
Worker FE	—
Observations	93,304

## Long-term wage decline

- Starting in ICT during boom (98-01)  $\Rightarrow$  **7% slower** long-term wage growth from 2003 to 2015
- **Worker FE**  $\rightarrow$  control for **non-random attrition** + selection on **levels**

	log(wage)	
ICT <sub>0</sub> $\times$ BoomCohort $\times$ 2003-05	0.001 (0.013)	ref.
ICT <sub>0</sub> $\times$ BoomCohort $\times$ 2006-10	-0.035** (0.014)	-0.048*** (0.010)
ICT <sub>0</sub> $\times$ BoomCohort $\times$ 2011-15	-0.073*** (0.019)	-0.077*** (0.015)
ICT <sub>0</sub> $\times$ Year FE	✓	✓
Worker controls $\times$ Cohort $\times$ Year FE	✓	✓
<b>Worker FE</b>	—	✓
Observations	93,304	92,901

## Ruling out other confounding

1. Robust to restricting the sample to **US firms** (e.g., Microsoft France)
2. Robust to controlling for **job termination**
3. [Alternative check: Job termination  $\uparrow$  7pp + Job termination associated with 3.5% long-term wage loss  $\Rightarrow$  Explains  $<0.3$  pp wage loss]
4. Constant effect across the wage distribution in **quantile regressions** (no winner-take-all)
5. Pattern of **attrition** is not different for the boom cohort
6. Robust to accounting for profit participation **participation in firm profit**

# Roadmap

---

The ICT Boom

Wage Dynamics

Role of Capital Flows

Mechanism

Wrap-up

## Capital Flows

---

Do capital flows amplify the negative effect on aggregate HK?

1. **Allocative effect:** depends on which ICT firms receive the most capital

- Firms whose workers' HK depreciate the most? The least?

→  $\text{Cov}[\text{Capital flow, HK accumulation}]?$

(K flow versus L flow)

## Allocative effect: Capital flows to firms with largest HK depreciation

- Wage discount **only** in firms with above-median capital availability
- $\text{Cov}[\text{Capital flow, HK accumulation}] < 0 \Rightarrow \text{aggregate labor productivity} \downarrow$

Proxy of capital availability:	log(Wage)		
	1999 return (Industry level)	1999 P/S (Industry level)	Equity issuance (Industry×geo ×entry-year level)
	(1)	(2)	(3)
$\text{ICT}_0 \times \text{Boom cohort} \times 2011-15$	0.022 (0.044)	0.007 (0.042)	-0.029 (0.025)
$\text{ICT}_0 \times \text{Capital availability} \times \text{Boom cohort} \times 2011-15$	-0.129*** (0.049)	-0.113** (0.047)	-0.081*** (0.031)
$\text{ICT}_0 \times \text{Year FE}$	✓	✓	✓
$\text{Worker controls} \times \text{Cohort} \times \text{Year FE}$	✓	✓	✓
$\text{Worker FE}$	✓	✓	✓
Observations	60,420	60,420	85,128

## Direct effect: Does capital flow cause faster HK depreciation?

2. **Direct effect:** easy financing may worsen average project quality and **causally** accelerates individual-level HK depreciation
- Alternatively,  $\text{Cov}[\text{Capital flow, HK depreciation}]$  may be driven by omitted factor: technology change  $\Rightarrow$  capital flow and HK depreciation
  - Test: re-estimate Cov holding technology fixed  $\rightarrow$  **within narrow sectors**

## Direct effect: Capital flow causes faster HK depreciation?

- Industry×Cohort×Year FE = within industry, across geography → control for technology shocks

	log(Wage)	
	Equity issuance (Industry×geo×entry-year level)	
Proxy of capital availability:	(3)	(4)
ICT <sub>0</sub> × Boom cohort × 2011-15	-0.029 (0.025)	— —
ICT <sub>0</sub> × Capital availability × Boom cohort × 2011-15	-0.081*** (0.031)	-0.083** (0.035)
ICT <sub>0</sub> × Year FE	✓	✓
Worker controls×Cohort×Year FE	✓	✓
Worker FE	✓	✓
Industry×Cohort×Year FE	—	✓
Observations	85,128	85,128

# Roadmap

---

The ICT Boom

Wage Dynamics

Role of Capital Flows

Mechanism

Wrap-up

## What drives human capital depreciation?

Hypothesis: Skill obsolescence

- Skills are **vintage** specific → made obsolete by technological change
- Worsened by easy financing if lower quality technologies are funded
- Test: compare jobs with different level of **technological content**

## Skill obsolescence

- Universe of workers by occupation level: high / middle / low skill
- Wage decline **largest** in **high-skill** occupations

	log(Wage)					
	High-skill		Middle-skill		Low-skill	
	(1)	(2)	(3)	(4)	(5)	(6)
ICT <sub>0</sub> × Boom cohort × 2011-15	-0.077*** (0.015)	-0.029 (0.025)	-0.068*** (0.014)	-0.039* (0.023)	-0.022 (0.020)	-0.027 (0.040)
ICT <sub>0</sub> × Capital availability × Boom cohort × 2011-15		-0.081*** (0.031)		-0.033 (0.029)		-0.004 (0.041)
Worker controls×Cohort×Year FE	✓	✓	✓	✓	✓	✓
Worker FE	✓	✓	✓	✓	✓	✓
Observations	92,901	85,128	206,918	186,477	250,620	218,927

## Skill obsolescence

- Universe of workers by occupation level: high / middle / low skill
- Wage decline **largest** in **high-skill** occupations
- ... particularly so if **large inflow of capital**

	log(Wage)					
	High-skill		Middle-skill		Low-skill	
	(1)	(2)	(3)	(4)	(5)	(6)
ICT <sub>0</sub> × Boom cohort × 2011-15	-0.077*** (0.015)	-0.029 (0.025)	-0.068*** (0.014)	-0.039* (0.023)	-0.022 (0.020)	-0.027 (0.040)
ICT <sub>0</sub> × <b>Capital availability</b> × Boom cohort × 2011-15		-0.081*** (0.031)		-0.033 (0.029)		-0.004 (0.041)
Worker controls×Cohort×Year FE	✓	✓	✓	✓	✓	✓
Worker FE	✓	✓	✓	✓	✓	✓
Observations	92,901	85,128	206,918	186,477	250,620	218,927

# Roadmap

---

The ICT Boom

Wage Dynamics

Role of Capital Flows

Mechanism

Wrap-up

## Wrap-up

### Two main results:

1. Skilled workers starting in booming tech sector eventually **lose human capital**
  - Wage **6%–8% lower fifteen years out**
  - Explained by **skill obsolescence** not by labor market imbalance and selection
2. Aggregate skill obsolescence **amplified by easy financing**

## Wrap-up

### Implications:

- Skill-biased technological change?
  - **Our paper:** *within* skilled workers, those who develop and implement new technologies (who represent one-third of the boom cohort) lose out
- Growth-enhancing technology bubble?
  - Maybe positive externalities, **but**
  - Capital allocated to firms that do not enhance their workers' human capital → lower aggregate labor productivity

## ICT boom: stock price/sales per share

---

## ICT boom: firm entry/stock of firms

---

## ICT boom: capital reallocation

---

## ICT boom: skilled labor market entrants

[Back](#)

## Wage premium: boom cohort vs. post boom cohort

## Wage premium: boom cohort vs. pre boom cohort

## Worker controls

	log(Wage)				
	(1)	(2)	(3)	(4)	(5)
$ICT_0 \times \text{Boom cohort} \times 2006-10$	-0.035** (0.014)	-0.048*** (0.010)	-0.043*** (0.010)	-0.041*** (0.011)	-0.045*** (0.013)
$ICT_0 \times \text{Boom cohort} \times 2011-15$	-0.073*** (0.019)	-0.077*** (0.015)	-0.075*** (0.015)	-0.067*** (0.016)	-0.078*** (0.019)
